Does organizational formalization facilitate voice and helping organizational citizenship behaviors? It depends on (national) uncertainty norms

Abstract
Prosocial work behaviors in a globalized environment do not operate in a cultural vacuum. We assess to what extent voice and helping organizational citizenship behaviors (OCBs) vary across cultures, depending on employees’ perceived level of organizational formalization and national uncertainty. We predict that in contexts of uncertainty, cognitive resources are engaged in coping with this uncertainty. Organizational formalization can provide structure that frees up cognitive resources to engage in OCB. In contrast, in contexts of low uncertainty, organizational formalization is not necessary for providing structure and may increase constraints on discretionary behavior. A three-level hierarchical linear modeling analysis of data from 7,537 employees in 267 organizations across 17 countries provides broad support for our hypothesis: perceived organizational formalization is weakly related to OCB, but where uncertainty is high; formalization facilitates voice significantly, helping OCB to a lesser extent. Our findings contribute to clarifying the dynamics between perceptions of norms at organizational and national levels for understanding when employees may engage in helping and voice behaviors. The key implication is that managers can foster OCB through organizational formalization interventions in uncertain environments that are cognitively demanding.

Keywords: organizational citizenship behavior; culture; uncertainty; formalization; multilevel analysis

INTRODUCTION
Organizational citizenship behavior (OCB) is central for the survival of modern businesses (Organ, Podsakoff, & MacKenzie, 2006). Voice and helping behaviors are two types of OCB (Van Dyne & LePine, 1998) that allow for more efficient and smooth functioning of the organization and more innovation and creativity (Organ et al., 2006). Helping is defined as proactive interpersonal behavior directed towards others that strengthens existing relationships (Van Dyne, Cummings, & Parks, 1995; Tröster & van Knippenberg, 2012). Voice behavior involves speaking up with suggestions for change, challenging work routines that hinder effectiveness, and acting on one’s own initiative to make changes to one’s own task routines. OCB is essential for organizations to thrive, but they can be risky for individuals (especially voice, due to its potentially challenging nature), and therefore only flourish in certain contexts.

Compared with the wealth of research on individual-level predictors of OCB, such as motivation and personality, there has been less exploration of organizational and national-level predictors of OCB (Carpenter, Berry, & Houston, 2014; Eatough, Chang, Miloslavic, & Johnson, 2011). This relative neglect is problematic, because the contribution of organizational factors may be contingent on the larger context, making one-size-fits-all recommendations inappropriate for international businesses (Beugelsdijk, Kostova, & Roth, 2017; Clark, Li, & Shepherd, 2017; Mahajan & Toh, 2017; Tsui, Nifadkar, & Ou, 2007). Understanding the interaction of contextual variables at organizational level and in a cultural context at the national level for facilitating OCB is important for business (Smith, Peterson, & Thomas, 2008; Tröster & van Knippenberg, 2012; Tsui et al., 2007). Our objective is to examine the joint influence of organizational formalization and national uncertainty on OCB to deepen our understanding of when and how culture matters for international business (Kirkman, Lowe, & Gibson, 2017; Beugelsdijk et al., 2017).

Uncertainty negatively affects work behavior at multiple levels of analysis (Cheng & Chan, 2008; Eatough et al., 2011; Griffin, Guedhami, Kwok, Li, & Shao, 2017). Discretionary behaviors such as OCB require cognitive resources and higher levels of cognitive control: uncertainty is cognitively taxing and reduces both feelings of control and the ability of individuals to pay attention to discretionary behaviors (e.g., Eatough et al., 2011; Paas, van Gog, & Sweller, 2010; Qian, Cao, & Takeuchi, 2013; Shin, Taylor, & Seo, 2012). Uncertainty is a powerful motivator to engage in coping behavior to re-establish certainty, but this motivation may interfere with discretionary work behaviors (van den Bos & Lind, 2002). People prefer certainty about how to behave and what to expect in one’s immediate and extended social and physical environment for reasons of social survival (Burns & Stalker, 1961; Hogg, 2007; van den Bos & Lind, 2002) but environments differ in their overall predictability (House, Hanges, Javidan, Dorfman, & Gupta, 2004; see also Doh, Rodrigues, Saka-Helmhout, & Makhija, 2017). We focus on nation-level processes that characterize perceptions of uncertainty within nations, due to institutional, political, and economic forces that shape everyday routines and practices (Beugelsdijk et al., 2017; House et al., 2004; for institutional approaches to uncertainty, see also Schubert, Baier, & Rammer, 2017; Young, Welter, & Conger, 2017).

At the organizational level, formalization is likely to influence levels of OCB. One standard assumption in management is that increasing formalization, in the sense of rules and procedures, reduces employee freedom by prescribing and enforcing procedures and regulations about appropriate actions – constraining employees’ ability to engage in discretionary behaviors and risking the alienation of employees, which is likely to decrease motivation to engage in OCB (Adler, 2012; Hirst, 2011; van Knippenberg, Chen, & Sacramento, 2011; Juillerat, 2010; Organ et al., 2006; Organ & Greene, 1981). At the same time, formalization enables efficiency in production through standardizing work procedures, which helps to overcome role ambiguities and allows individuals to understand better what is expected of them (Organ & Greene, 1981). This clarification of roles and responsibilities reduces conflict and role stress, and promotes cooperation, which in turn is likely to set conditions that facilitate OCB (Adler, 2012; Kahn, Wolfe, Quinn, & Snoek, 1964). Therefore the empirical links between formalization and OCB have been mixed (see also Raub, 2008), suggesting that the extent to which formalization is conducive for OCB may depend on the larger context within which a business is operating (Hirst et al., 2011; Jiang, Colakoglu, Lepak, Blasi, & Kruse, 2014).

Bringing the two lines of research together via perceived norms, we argue that organizational formalization has compensatory effects on OCB.
ocb, formalization & uncertainty norms
ronald fischer et al

methods

sample
we sampled 7,537 employees from 267 organizations (average n = 27.7) in 17 countries recruited through professional networks with the aim of achieving a cross-section of locally relevant and representative organizations. given the diversity of industries and business forms globally, we explicitly decided not to sample match organizations, as this would result in locally unrepresentative samples. we targeted medium and large local organizations that represent typical employers in the particular region of the nation (see table 1). we controlled for demographic and organizational variables, and we found that they do not change any of the main findings reported (descriptive statistics are presented in table 2).

measures

dependent variables
for ocb, we used five voice items and seven helping items from van dyne and lepîne (1998). the answers were recorded on a scale ranging from 1 (strongly disagree) to 7 (strongly agree). reliability overall was good (voice: alpha = .89; helping: alpha = .91). self-report measures of ocb have been found to provide valid estimates of ocb effects (carpenter et al., 2014). we conducted a series of pilot studies with employees in the uk, us, germany, turkey, argentina, brazil, malaysia, and nz (total n = 2,213), which suggested that voice and helping scales captured behaviors that (a) are important for businesses, (b) are empirically distinct and provide non-redundant information, and (c) show better validity and reliability across the cultural samples studied compared to other instruments measuring ocb (podsakoff, mackenzie, moorman, & fetter, 1990) or in-role versus extra-role behavior (william & anderson, 1991; further details about our pilot studies testing the helping and voice constructs across cultural samples are included in the online supplementary material for this article).

independent variables
for perceived organizational formalization, we adapted five formalization items (fischer et al., 2014) from the competing value framework of organizational culture (cameron & quinn, 1999) that captures central elements of formalization (fry & slocum, 1984). an example item is: “the jobs are...
performed according to previously defined procedures.” Perceived norms were measured on a scale ranging from “never” (1) to “always” (7). Cronbach’s alpha was adequate (total sample: \(\alpha = 0.78\)). The intraclass correlation (ICC) for formalization at the organization level was .10 (.12 for organizational support, a control variable discussed below), and the average agreement \(r_{wg}\) (James, Demaree, & Wolf, 1984) for formalization within organizations was .92 (.90 for organizational support); both indicators justify aggregation to the organization level. Multilevel fit between individual and organizational level (constraining loadings to be equal) was acceptable: \(\chi^2 (82) = 908.31, p < .0001, \text{CFI} = .94, \text{TLI} = .94, \text{RMSEA} = .042, \text{SRMR}_{\text{within}} = .042, \text{SRMR}_{\text{between}} = .083\).

For perceived uncertainty, we adopted four items measuring normative perceptions of nation-level uncertainty (Sully de Luque & Javidan, 2004), with an example item being: “Most people lead highly structured lives with few unexpected events” measured on five-point scales (reversed scored, 1 “very typical” to 5 “not at all typical”). These items are phrased in terms of observable behaviors, therefore, allowing us to capture perceptions of descriptive norms using a referent-shift consensus model (Chan, 1998). Higher scores indicate more uncertainty. Reliability at the nation level was .87, showing acceptable measurement properties at the intended theoretical level. The average ICC(1) was .054, justifying aggregation. A multilevel confirmatory factor analysis (CFA) testing metric invariance across levels demonstrated acceptable fit: \(\chi^2 (12) = 695.42, p < .0001, \text{CFI} = .95, \text{TLI} = .92, \text{RMSEA} = .025, \text{SRMR}_{\text{within}} = .018, \text{SRMR}_{\text{between}} = .074\). Hence, the structure fits well at both levels.

All variables were translated using an expert committee approach with adjudicators (Harkness, Pennell, & Schoua-Glusberg, 2004). A simultaneous confirmatory factor analysis including all

Note: * \(p < .05\).

Formalization and employee support are disaggregated from the organizational to the individual level; certainty is disaggregated from the nation level to the individual level.
measures showed good fit: $\chi^2 (289) = 4057.19$, $p < .0001$, $CFI = .96$, $TLI = .95$, $RMSEA = .044$, $SRMR = .033$. Testing cross-cultural measurement invariance, we found acceptable fit for configural invariance: $\chi^2 (4913) = 12,628$, $p < .0001$, $CFI = .91$, $RMSEA = .063$; and metric invariance: $\chi^2 (5249) = 13,493$, $p < .0001$, $CFI = .91$, $RMSEA = .063$, $\Delta CFIC = .006$, $\Delta RMSEA = .000$.

Control Variables
In order to isolate the effect of formalization on OCB in the context of (un)certainty, we conducted an array of sensitivity tests to analyze the effect of control variables at the individual, organizational, and national level. For further information on these sensitivity tests, please see the online supplementary material for this article.

At the individual level, we controlled for age and managerial position, because these variables correlated with OCB in previous studies (e.g., Carpenter et al., 2014; O’Driscoll & Roche, 2015). No gender differences were found, and therefore gender is not included in our models.

At the organizational level, organization-based support (from leaders, co-workers, general perceptions of support) is one of the strongest predictors of OCB, exceeding other theoretically important predictors such as personality and leadership perceptions (Carpenter et al., 2014), and one of the most effective organization-level facilitators of voice behavior specifically (Chiaburu, Lorinkova, & Van Dyne, 2013). Controlling for broad organizational support as one of the empirically strongest predictors of OCB makes our analyses conservative. We measured organizational support with six items (Fischer et al., 2014, for example: “employees are supported by their superiors”). We also controlled for industry, comparing primary, retail and sales, finance, and education with a residual category.

At the nation level, we controlled for economic development using Gross National Income (GNI) per Capita adjusted for Purchasing Power Parity. We also controlled for power distance, which refers to the extent to which cultures are hierarchically differentiated, and is conceptually related to formalization (Lee & Antonakis, 2014): more hierarchical cultures rely more on formalized rules and authority (Huang & Van de Vliert, 2003). It is important to control for power distance to differentiate uncertainty management dynamics from cultural socialization effects (individuals prefer formalization because they are socialized into a hierarchical system). We created a composite score, averaging Hofstede’s (1980) and GLOBE’s (House et al., 2004) power distance scores with Schwartz’s (2006) Hierarchy index. This index showed good validity and reliability (see Supplementary Material for more information).

Analytical Strategy
We used a three-level model in HLM6.01 (Raudenbush & Bryk, 2002) to predict variability in helping and voice behavior at level 1. Age as a control variable at level 1 was centered on the national mean. At level 2, we entered formalization (and organizational support as a control variable) centered on the national mean. Industry effects at level 2 were dummy-coded. At level 3, we entered grand-mean centered uncertainty to examine the theoretically predicted interaction effect of uncertainty on formalization slopes. Nation-level control variables were also grand-mean centered.

Common method variance and response styles are a major concern in self-report measures ( Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). To control for method variance, we randomly split our sample, with one random half used for estimating the individual-level effects (voice and helping behavior) and the other random half used for estimating the organization-level effects (formalization norms). The evaluation of organizational norms is therefore independent from the responses to the self-report behaviors, ruling out common method explanations for our pattern of findings. This method is equivalent to obtaining peer reports of the environmental context variables (organizational norms at level 2) and has been used successfully in previous research (Ostroff, Kinicki, & Clark, 2002).

RESULTS
Our hypothesis predicted an interaction between perceived formalization at the organizational level and perceived uncertainty at the nation level. For voice, we found a significant effect, which explained 99.57% of the variability in slopes across countries (see Table 3). Supporting our hypothesis, the effect of formalization is stronger in contexts of higher uncertainty norms and is weaker for lower uncertainty norms (see Figure 1). For helping behavior, the interaction was in the predicted direction, but only marginally significant ($p = .07$), explaining 31.12% of the conditional variance in slopes between countries. In the supplement, we report additional analyses in which we
controlled for age and occupation (level 1); organizational support and dummy-coded industry effects (level 2), as well as rival explanatory variables at the nation level (wealth and power distance, level 3). For control variables, managers reported higher levels of voice behavior. Among organization-level control variables, organizational support showed a strong and positive effect on both helping and voice. Greater organizational support was associated with increased levels of OCB. Importantly, the interaction effect of uncertainty by formalization on voice remained significant when controlling for all these variables: $\gamma_{011} = .65$, $p < .001$. The interaction effect for helping was in the predicted direction, but not significant: $\gamma_{011} = .08$, $p > .05$.

**DISCUSSION**

We found that perceived organizational formalization is more strongly associated with increased voice (and also to some extent helping) OCB in highly uncertain cultural environments at the nation level. Organizations operating in uncertain macro-level environments can benefit from clearly specified rules and procedures to foster voice and helping OCB. Our research clarifies the conflicting results of both formalization and uncertainty at organizational level on OCB, when nation-level uncertainty is not being considered (Hirst et al., 2011; Mahajan & Toh, 2017). Our results contextualize previously noted negative effects of formalization (Adler, 2012; Juillerat, 2010; Organ & Greene, 1981; Organ et al., 2006) by identifying under what circumstances such effects are subverted.

Normative perceptions play a crucial role for understanding how contextual features influence work behavior (Leung & Morris, 2015; Morris et al., 2015). We expand previous work on antecedents of OCB by examining the interplay of perceived norms at organizational and cultural levels, adopting a poly-contextual meso-level approach (Tsui et al., 2007). The results show that organization-level findings alone shed light on only part of the context of international business. Businesses operating in countries with higher uncertainty and with less stable institutional, political, and economic forces that shape everyday routines and practices (House et al., 2004) are advised to rethink their organizational practices to provide the necessary support and structure for local employees (see also

Journal of International Business Studies
related work on institutional voids, e.g., Doh et al., 2017). Our study provides one specific case study which demonstrates these compensatory effects on OCB. Importantly, we demonstrated that shared normative perceptions are important for statistically predicting OCB. This is an important avenue for further research as more and more businesses move into national contexts that are culturally, economically, and institutionally different from Western societies and norms vary from Western expectations.

In terms of limitations, the diversity of business and economic environments did not allow us to match organizations across cultures, which may increase the error variance at the organizational and nation level, reducing the likelihood of significant findings (Schmitt, Allik, McCrae, & Benet-Martinez, 2007). Thus the fact that we nevertheless obtained significant results supports the robustness of the observed effects. We did not include individual difference variables in our study beyond the demographic control variables; future research could test the relative importance of organizational versus individual variables in a multilevel framework.

Perceived norms have significant managerial implications, especially for understanding differences between cultures (Morris et al., 2015). Managers can help employees to free up energy and cognitive resources by providing clear guidelines on how to perform their work. To the extent that these formalization norms provide normative guidance without being coercive (Adler, 2012), the levels of certainty that such norms may encourage can motivate employees to help their co-workers and to come forward with ideas for improvement of work procedures. The provision of formal rules and guidelines can be particularly effective in those contexts where employees are faced with uncertainty on a daily basis. For example, if there is uncertainty about employability laws at government level (e.g., due to political changes), a company that makes a clear statement about their roles and procedures can instill trust and confidence among staff to voice their opinions. Our exploration of whether employees’ voice and helping behavior are facilitated or obstructed through formalization allows for a more balanced understanding of how and in which cultural contexts formalization creates value for organizations.

ACKNOWLEDGEMENTS

The research was supported by various grants by Victoria University of Wellington, New Zealand, and the School of Psychology at Victoria University of Wellington. Ronald Fischer was supported by a Marie-Curie Cofund Senior Fellowship while resident at the Aarhus Institute of Advanced Studies, Denmark. The work of Jan Cieciuch was supported by Grant 2011/01/D/HS6/04077 from the Polish National Science Centre. We are grateful for comments and suggestions by Anne-Wil Harzing, Paul Griseri, Jonathan Searle, Peter Smith, Mark Peterson, Diana Boer, and Melanie Vauclair during various stages of the preparation process as well as the editor Mary Zellmer-Bruhn and three anonymous reviewers who provided constructive feedback.

REFERENCES

**ABOUT THE AUTHORS**

Ronald Fischer is a Professor in Psychology at Victoria University of Wellington, New Zealand. He received his Ph.D. in Social Psychology from Sussex University, UK. His current research interests focus on the evolution of cultural differences (esp., values, personality, well-being, and social cooperation) and cultural evolution of rituals. He serves on a number of editorial boards in psychology and business and has been listed as one of the most highly cited cross-cultural psychologists.

Maria Cristina Ferreira received her Ph.D. in Psychology from Getulio Vargas Foundation in Rio de Janeiro, Brazil. She is currently a Professor of Social and Organizational Psychology at Salgado de Oliveira University, Rio de Janeiro, Brazil. Her research interests concern cross-cultural psychology, organizational psychology, and positive social psychology.

Nathalie van Meurs received her Ph.D. from the University of Sussex in England. She is a Senior Lecturer at Middlesex University Business School and a recipient of AOM 2016 and BAM 2008 Best Paper Awards. Her research interests concern cultural values, identity, and person–environment fit. She teaches courses in cross-cultural management and ethics at Middlesex University Business School.

Kubilay Gok is an Assistant Professor of Management and Human Resources at Winona State University. He is the recipient of the “Outstanding International Implications Paper Award” from the OB Division and was one of the finalists for the Carolyn Dexter Best Paper Award at the Academy of Management in 2016. He researches ethical leadership, meaningful work, justice, and employee well-being.

Ding-Yu Jiang is a Professor of I/O Psychology at National Chung Cheng University, Taiwan. He received his Ph.D. in I/O Psychology from National Taiwan University. His research focuses on issues on employee loyalty/commitment, leadership in the Chinese context, and cross-cultural psychology and management. During 2010, he was a Fulbright Visiting Scholar at the University of Illinois at Urbana–Champaign.

Johnny R J Fontaine is an Associate Professor in the Department of Personnel Management, Work and Organizational Psychology, Ghent University, Belgium. He received his Ph.D. on the cross-cultural comparability of value assessment based on the Schwartz Value Survey from the K. U. Leuven, Belgium. His research mainly focuses on emotions, emotional intelligence, and its assessment in a cross-cultural context.

Charles Harb is a Professor of Social Psychology in the Department of Psychology of the American University of Beirut, Beirut, Lebanon. His research includes investigating sectarianism, social identities, identity motives and preferences, self-concept across cultures, and social cohesion. He is the recipient of “Outstanding International Implications Paper Award,” OB Division – Academy of Management in 2016.

Jan Cieciuch is a Researcher at the University Research Priority Program on Social Networks at the University of Zurich and an Associate Professor in the Institute of Psychology at the Cardinal Wyszynski University in Warsaw, Poland. His interests are applications of structural equation modeling especially in psychology, with focus on the investigation of human values and personality traits.
Mustapha Achoui is a Professor of Psychology and Management, and the Vice President for Planning, Research and Development in the Arab Open University in Kuwait. He received his Ph.D. from Rensselaer Polytechnic Institute, New York, in Organizational Behavior. His research interests are mainly in cross-cultural studies, leadership, organizational motivation, and performance.

Ma Socorro D Mendoza is currently affiliated with Rutgers University. She supervises care coordinators assisting patients seeking substance abuse disorder (SUD) treatment. She received her Ph.D. in Psychology from Victoria University of Wellington, New Zealand. Her research interests focus on understanding how cultural identity, values, social norms, and life experiences shape the perceptions of psychological and physical well-being.

Arif Hassan is currently a Professor of Organizational Behavior and Human Resources Management in the Department of Business Administration, International Islamic University Malaysia. Previously, he has worked for nearly two decades in India. His research works are in the area of organizational justice, leadership, motivation, HR practices, job quality, and work outcomes.

Donna Achmadi currently works with Explore Specialist Advice New Zealand, a company under HealthCare New Zealand, which provides specialized behavior support services for people with disabilities. She was the recipient of Marsden Grant Scholarship from the Royal Society of New Zealand.

Andrew A Mogaji is a Professor of Industrial and Organizational Psychology in the Department of Psychology at the Benue State University, Makurdi, Nigeria. His areas of specialization include organizational behavior, human resource management, cross-cultural psychology, and psychometrics. He is currently a Director of the International Association of Applied Psychology.

Amina Abubakar is an Associate Professor of Psychology and Public Health at Pwani University, Kilifi, Kenya. She is also an honorary fellow at the Department of Psychiatry, University of Oxford, UK. Her main research interests are in the development of culturally appropriate and contextually relevant strategies for identifying, monitoring, and rehabilitating at-risk children. She is also interested in cross-cultural studies.
